

AP IP address in AP Up/Down log messages and e-mail alarms

We faced with situation when APs has two uplinks both of them with NAT, and change of external IP address means that smth happen with ISP or our router to which we haven't remote access.

It will be very nice to see current AP IP address in alarm email messages and vWLAN logs along with other information (AP name, MAC etc).

I have AP up/down messages in template where e-mail alarms sent to me, it would be very easy to understand what happen just compare old and new IP in two emails
