

Q&A

How do I configure my ADTRAN Express XR/XRT/3000 for a DTE rate of 230.4 kbps?

Q:

How do I configure my ADTRAN Express XR/XRT/3000 for a DTE rate of 230.4 kbps?

A: On the back of the unit is a row of switches. The switch that is marked 1 must be set in the up position in order for the unit to work at a speed of 230.4 kbps. In order to work at a rate of 230.4 kbps your computer must have a 16650 UART or higher on your serial card. Also, the serial card being used must be supplied with appropriate drivers for your operating system (i.e. Windows[®] 95, 98 or NT 4.0). If you have a Macintosh computer rates up to 230.4 kbps should be supported without additional hardware or software. However, some older Macs do not support 230.4 kbps.
