Q&A

How do I configure remote site IQ units so that I can manage them from the host site using inband management?

Q:
How do I configure remote site IQ units so that I can manage them from the host site using inband management?

A: The management DLCI options in the network port configuration of the remote site unit define which DLCIs the IQ unit will monitor for its own IP address. These management DLCIs should be your locally significant DLCIs that show up in the DLCI list of the remote site unit. If RFC 1490/2427 encapsulated Frame Relay data is used, the IQ will respond when the unit detects its own IP address. Management is performed at the IP layer.
