	MSP 2.2.0 Release Notes	
Release Notes	Release Date: August 4, 2010	Notes Revision: August 4, 2010

Resolved Issues for 2.2.0-4582

These are issues that have been resolved since previous releases

- Could not connect via HTTPS from Internet Explorer 8.
- VQM data was not stored on server as long as the selectable time applies.
- SIP Collector stops collecting after receiving packets with errors.
- PAP secret key could not be entered.
- Legal banner does not display for SSH
- Filters did not return back to normal when selecting none.
- Upgrades from version before 2.1 might fail
- Devices with a hyphen in the DNSname would fail to update
- Radius server would not work if configured with a server DNS name instead of a server IP address.
- The Radius configuration panel would show "None" as an authentication method which was not valid.
- On some systems, old job data may not be purged from the database properly resulting in sluggish performance.

Errata

These are issues that were reported from the field or discovered during internal testing but were unresolved at the time of release.

- A sysLocation value longer than 64 characters reported by a device results in no device update in the database.
- Units that only have enough flash for one firmware image will show device alerts for a missing secondary image
- Cannot upload firmware to MSP server when logged in via HTTPS
- GUI browser will lock up when viewing VQM statistics on device page when more than 2000 calls are present within a 24 hour period
- Cannot delete a device that has a restore job associated with it
