ADTRAN

Configuring SPRE Mapping in AOS
Requires A1.05.00 Firmware or Higher in A1 family
Requires A2.03.00 Firmware or Higher

Overview
This document describes *SPRE mapping.* Using this feature, the AOS voice product may be configured such that certain functions are assigned to a given SPRE code. For example, the function "Block Caller-ID Delivery" can be assigned to *62 instead of its default of *67. Functions can also be mapped to have no corresponding SPRE code.

Configuration
To configure a SPRE map, issue the following global configuration command:

hostname(config)# *voice spre-map <function> <*NX>*

Example
An example of a SPRE map is shown below. In this example, the SPRE code for "Block Caller-ID delivery" is set to *62.

```
!
!
voice spre-map block-callid-delivery *62
!
!
```
